Getting started (members)

1. **Install the tools.** Install Docker Desktop, VS Code and the VS Code extension **Dev Containers**. On Windows, if you can, recommend setting up WSL (a Linux system built into Windows). Docker runs much faster when the project files are inside WSL. (This website shows you detail steps to how to install WSL -> https://learn.microsoft.com/en-us/windows/wsl/install)

Quick WSL setup: run `wsl --install` in PowerShell (as Administrator). After `wsl --install`, Windows asks you to **restart**. Then an Ubuntu window opens and asks you to **create a username and password**. Turn on **Ubuntu** in Docker Desktop under Settings → Resources → WSL Integration, and type every command below in the **Ubuntu** window. Check that Docker works:

```
docker run hello-world
```

2. Fork and clone. Wait until the lead says the setup is merged. Then open `sfuosdev/github-ci-cd-bot` on GitHub, click **Fork**, and run:

```
cd ~
git clone https://github.com/YOUR_USERNAME/github-ci-cd-bot
cd github-ci-cd-bot
git remote add upstream https://github.com/sfuosdev/github-ci-cd-bot
code .
```

`origin` is your fork. `upstream` is the club repo. You pull from `upstream` and push to `origin`.

3. Open the dev container. In VS Code, click **Reopen in Container** (or press F1 and choose **Dev Containers: Reopen in Container**). Wait for `npm ci` to finish, then run `npm test`.

4. For each issue.

```
git switch main
git pull upstream main
git switch -c feature/ISSUE-ID-short-name
git add .
git commit -m "feat: what you did"
git push -u origin feature/ISSUE-ID-short-name
```

Then open a PR from your fork to `sfuosdev/github-ci-cd-bot` `main`, and write `Closes #NUMBER` in the description so the issue closes when it merges.

5. Every day while your PR is open.

```
git fetch upstream
git merge upstream/main
```

Small daily syncs prevent big merge conflicts at the end.

6. Review. A maintainer (probably project lead) reviews your PR, approves and merges it.

The sandbox repo. You have write access to `sfuosdev/ci-cd-bot-sandbox`. Clone it directly (no fork) and use branches there, because the bot can't comment on PRs that come from forks.

Common problems & fixes

Problem	Fix
"Cannot connect to the Docker daemon"	Docker Desktop isn't running. Open it and wait
Very slow on Windows	Your files are on **C:**. Clone inside the **Ubuntu** (WSL) window instead. Docker is faster in WSL
git commit gives "Please tell me who you are"	Run `git config --global user.name "Your Name"` and `git config --global user.email "you@example.com"` in the container
`npm ci` says package.json and the lockfile are out of sync	Someone changed `package.json` without committing the new lockfile. Run `npm install` and commit `package-lock.json`
CI fails at "Check Format"	Run `npm run format:write`, commit and push again
No "Reopen in Container" pop-up	Use F1 and type **Dev Containers: Reopen in Container**
